

Pedro Morago López-Vázquez

Senior QA Engineer: Test Automation, CI and Quality Engineering

pedro@pedromorago.com pedromorago.com linkedin.com/in/pedro-morago-lopezvazquez
github.com/pedromorago Santander, Spain (CET). Fully remote since 2021.

After a BSc in Mathematics at the University of Cantabria, I moved into software quality and have worked in test automation from the first day. At Fieldeas I took client projects from manual testing to automated Cypress suites; at IriusRisk I built Playwright and REST Assured automation and a Python optimization model that made CI faster and cheaper; at Alvatross I automate TM Forum APIs for a German telecom. Five years across process automation for companies outside tech, cybersecurity and telecom. Targeting Senior QA/SDet and Quality Engineering roles in test automation, CI and test infrastructure, and AI and model evaluation.

EXPERIENCE

Senior QA Engineer, Alvatross by SATEC

Jul 2026 – Present

Remote. Telecom OSS platform for EWE (Germany)

- Design and execute testing for TM Forum-based service-order flows across add, modify, delete, suspend and reactivate operations in Jira and Xray.
- Build API automation with Karate against TM Forum APIs, and created a one-click Postman smoke suite for post-deployment service checks.

QA Engineer, IriusRisk

May 2024 – Jun 2026

Remote. International cybersecurity SaaS, threat modeling

- Built a Python MILP optimization model for CI sharding: 42% faster in a one-worker benchmark; modelling production workers showed 4 containers instead of 7 could be about 8% faster and 41% cheaper.
- Led the testing strategy for a core Security Content module across backend, API and frontend layers.
- Designed Playwright and TypeScript E2E automation for a combinatorial rules engine using Page Objects, API-backed setup and data factories.
- Automated backend APIs with REST Assured and JUnit 5, including schema validation, negative cases and traceability; contributed to a TestCafe to Playwright migration that cut runtime by about 80%.

QA Engineer, Fieldeas

Jun 2021 – May 2024

Remote. Field service management SaaS

- Moved client projects from primarily manual testing to scalable Cypress and JavaScript E2E automation.
- Reported 500+ defects prioritized by product risk and business impact; validated data with SQL and coordinated releases with development.
- Onboarded and mentored teammates on QA tooling and automation practices.

STRENGTHS

- Mathematics background applied to optimization, combinatorial test design, edge cases and quantitative validation.
- Testing without an answer key: invariants, metamorphic relations, statistical checks and seeded defects that prove the checks work.
- Builder as well as tester: CI tooling, a Chrome extension for bug evidence, a public QA wiki with 50+ articles and a full-stack product of my own.

SKILLS

Automation: Playwright, Cypress, Selenium, TestCafe, Vitest, pytest, Hypothesis, fast-check

API and backend: REST Assured, JUnit 5, Karate, Postman, SQL

Programming: TypeScript, JavaScript, Java, Python

CI and tooling: GitHub Actions, Bitbucket Pipelines, Jenkins, Docker, Git, Jira, Xray, Qase, Confluence

Quality engineering: Test strategy, risk-based testing, E2E, API and integration testing; property-based, metamorphic, mutation and chaos testing; Shift Left, debugging, combinatorial test design

EDUCATION AND CERTIFICATION

BSc in Mathematics

University of Cantabria, 2015 – 2020

ISTQB Certified Tester

Foundation Level (CTFL) v4.0

ISTQB, Dec 2024

PROJECTS

Spin Trainer

pedromorago.com/work/spin-trainer

My own full-stack app, a poker range trainer, from idea to release: React and Spring Boot. 145 API tests, 37 Playwright specs, mutation testing; 8 real defects found.

Solver Validation Lab

github.com/pedromorago/solver-validation-lab

Testing numbers with no perfect oracle: an equity engine, a strategy validator and game solvers checked by best responses. 32 of 32 seeded defects caught.

Real-Time Testbed

github.com/pedromorago/real-time-testbed

WebSocket game server tested for retries, reconnects, races, timers and server crashes with a chaos simulator. 17 of 17 seeded bugs caught.

Game Integrity Lab

github.com/pedromorago/game-integrity-lab

Evaluation testbed for cheat-detection models on synthetic data: per-segment false positives and a regression gate. 11 of 11 seeded bugs caught.

LANGUAGES

English, professional working proficiency

Spanish, native
